

## Worcester Cyanobacteria Monitoring Collaborative

WCMC Results May 15, 2023							
Lake and Overall Risk	Phycoyanin Concentration (ug/I)	Particle Concentration (#/ml)	Cyanobacteria Density	Cyanobacteria Observed			
Bell Pond	ND	57	none				
Burncoat Pond	49	561	none				
Coes Reservoir	ND	105	low	Dolichospermum			
Cooks Pond	ND	42	none				
East Lake Waushacum	ND	44	none				
Ecotarium Pond	32	259	none				
Elm Park Pond	100	1999	some	Dolichospermum, Microcystis Debris			
Green Hill Park Pond	9	39	none				
Indian Lake	11	732	low	Dolichospermum, Microcystis, Microcystis Debr			
Jordan Pond	ND	42	none				
Kiver Pond	ND	74	none				
Leeseville Pond	ND	22	none				
Lake Quinsigamond	ND	124	low	Microcystis			
Little Indian Lake	ND	139	low	Microcystis			
Manchaug Pond	ND	52	some	Dolichospermum			
Newton Pond	9	64	none				
Patch Pond	ND	361	none				
Patch Reservoir	ND	43	none				
Salisbury Pond	28	161	low	Microcystis Debris			
Stevens Pond	ND	30	low	Dolichospermim			
Crystal Pond	ND	652	none				
Lake Chauncy	ND	34	none				
Lake Lashaway	9	59	some	Dolichospermum			
Previous Results for Lakes Not Tested this Period							
Farm Pond	ND	13	none	Last tested 4/29/23			

Results are based on methods that are not certified by the Commonwealth of MA but are presented as recommendations so that lake uses can make informed choices about their contact. We encourage people to use their best judgement, and "If in doubt, stay out!"

If you or your pet has been exposed to water that may contain cyanotoxins, rinse the areas with tap water immediately. If your pet has ingested or water containing cyanobcteria, contact your veterinarian as soon as possible.

## **Interpreting WCMC Results**

If you or your pet has been exposed to water that may contain cyanotoxins, rinse with tap water immediately. Do not let animals lick their fur. If your pet has ingested scums or water containing cyanobacteria, contact your veterinarian as soon as possible and see these CDC guidelines:

## Cyanobacterial Blooms: Information for Veterinarians | Harmful Algal Blooms | CDC.

The WCMC is a group of volunteer community scientists that is developing ways to assess risk to cyanotoxin exposure using fast and low cost methods. These results are based on methods that are not certified by the Commonwealth of MA but are presented as recommendations so that lake uses can make informed choices about their contact.

## We encourage people to use their best judgement, and "If in doubt, stay out!"

The WCMC does not measure cyanotoxins, instead the group uses four parameters to determine the **risk of cyanotoxin exposure**. These include **phycocyanin concentration**, **particle concentration**, **cyanobacteria density**, and the **cyanobacteria observed**. Each of the results are ranked and given a color to identify severity. The overall risk of exposure at each lake is determined by reviewing all four parameters together.

Risk of Exposure	Phycocyanin ug/I	Particles/ml	Comparative density of cyanobacteria
Almost none	0-15	0-1000	none
Low	15-20	1000-5000	low
Elevated	20-50	5000-10000	some
Blooming	>50	>10000	high
ND = Below detection limits			

**Risk of Exposure:** Overall risk of exposure to cyanotoxins in the waterbody based on a holistic interpretation of the data collected.

**Phycocyanin:** Cyanobacteria-specific pigment concentration in the water. The more phycocyanin there is in the water, the more cyanobacteria are present. However, because different kinds of cyanobacteria produce different quantities of phycocyanin, the risk of toxin production is different for the same concentration of phycocyanin when there are different cyanobacteria present.

**Particle Concentration:** Particles include living and non-living materials and can be a proxy for overall turbidity of the water. High concentrations of particles in the water can be indicative of cyanobacteria blooms, but can also be the result of other factors such as non-living debris and sediment. The phycocyanin concentrations and cyanobacteria density help to interpret if particles are due to cyanobacteria or other sources.

**Cyanobacteria Density:** The ratio of cyanobacteria to other organisms in the sample. Higher densities can indicate elevated risk of exposure to cyanotoxins. Density results do not consider concentration, but in general, systems dominated by cyanobacteria are at higher risk for producing toxins.

**Cyanobacteria Observed:** Genera of cyanobacteria identified in the sample. Because different cyanobacteria have different levels of phycocyanin, observed cyanobacteria help determine the threshold of phycocyanin that is considered risky.
