

## Worcester Cyanobacteria Monitoring Collaborative

WCMC Results May 27, 2023							
Lake and Overall Risk	Phycoyanin Concentration (ug/I)	Particle Concentration (#/ml)	Cyanobacteria Density	Cyanobacteria Observed			
Bell Pond	ND	NA	none				
Burncoat Pond	13	NA	low	Aphanizomenon, Dolichospermum			
Coes Reservoir	ND	NA	low	Aphanizomenon, Dolichospermum			
Cooks Pond	ND	NA	none				
East Lake Waushacum	ND	NA	none				
Ecotarium Pond	10	NA	none				
Elm Park Pond	327	NA	some	Dolichospermum			
Farm Pond	ND	NA	some	Dolichospermum			
Green Hill Park Pond	ND	NA	low	Microcystis, Microcystis Debris			
Indian Lake	ND	NA	some	Microcystis, Microcystis Debris			
Jordan Pond	ND	NA	none				
Kiver Pond	ND	NA	none				
Leeseville Pond	ND	NA	none				
Lake Quinsigamond	13	NA	low	Dolichospermum			
Little Indian Lake	10	NA	none				
Manchaug Pond	ND	NA	none				
Newton Pond	ND	NA	none				
Patch Pond	ND	NA	none				
Patch Reservoir	10	NA	none				
Salisbury Pond	12	NA	some	Microcystis, Microcystis Debris			
Lake Ellie	27	NA	none				
Stevens Pond	ND	NA	none				
Crystal Pond	18	NA	none				
Lake Chauncy	ND	NA	none				
Lake Lashaway	ND	NA	none				

Results are based on methods that are not certified by the Commonwealth of MA but are presented as recommendations so that lake users can informed choices about their contact. We encourage people to use their best judgement, and "If in doubt, stay out!"

If you or your pet has been exposed to water that may contain cyanotoxins, rinse the areas with tap water immediately. If your pet has ingested or water containing cyanobcteria, contact your veterinarian as soon as possible.

## **Interpreting WCMC Results**

If you or your pet has been exposed to water that may contain cyanotoxins, rinse with tap water immediately. Do not let animals lick their fur. If your pet has ingested scums or water containing cyanobacteria, contact your veterinarian as soon as possible and see these CDC quidelines:

## Cyanobacterial Blooms: Information for Veterinarians | Harmful Algal Blooms | CDC.

The WCMC is a group of volunteer community scientists that is developing ways to assess risk to cyanotoxin exposure using fast and low cost methods. These results are based on methods that are not certified by the Commonwealth of MA but are presented as recommendations so that lake uses can make informed choices about their contact.

## We encourage people to use their best judgement, and "If in doubt, stay out!"

The WCMC does not measure cyanotoxins, instead the group uses four parameters to determine the **risk of cyanotoxin exposure**. These include **phycocyanin concentration**, **particle concentration**, **cyanobacteria density**, and the **cyanobacteria observed**. Each of the results are ranked and given a color to identify severity. The overall risk of exposure at each lake is determined by reviewing all four parameters together.

Risk of I	Exposure	Phycocyanin ug/I	Particles/ml	Comparative density of cyanobacteria
Almo	st none	0-15	0-1000	none
L	ow	15-20	1000-5000	low
Elev	ated	20-50	5000-10000	some
Bloc	oming	>50	>10000	high
ND = Below o	letection limits			

**Risk of Exposure:** Overall risk of exposure to cyanotoxins in the waterbody based on a holistic interpretation of the data collected.

**Phycocyanin:** Cyanobacteria-specific pigment concentration in the water. The more phycocyanin there is in the water, the more cyanobacteria are present. However, because different kinds of cyanobacteria produce different quantities of phycocyanin, the risk of toxin production is different for the same concentration of phycocyanin when there are different cyanobacteria present.

**Particle Concentration:** Particles include living and non-living materials and can be a proxy for overall turbidity of the water. High concentrations of particles in the water can be indicative of cyanobacteria blooms, but can also be the result of other factors such as non-living debris and sediment. The phycocyanin concentrations and cyanobacteria density help to interpret if particles are due to cyanobacteria or other sources.

**Cyanobacteria Density:** The ratio of cyanobacteria to other organisms in the sample. Higher densities can indicate elevated risk of exposure to cyanotoxins. Density results do not consider concentration, but in general, systems dominated by cyanobacteria are at higher risk for producing toxins.

**Cyanobacteria Observed:** Genera of cyanobacteria identified in the sample. Because different cyanobacteria have different levels of phycocyanin, observed cyanobacteria help determine the threshold of phycocyanin that is considered risky.
